

CONCEPTUAL FRAMEWORK & BENEFITS OF ENERGY EFFICIENCY IN BUILDINGS

Brahmanand Mohanty, Ph.D.
 Visiting Faculty, Asian Institute of Technology (AIT)
 Regional Adviser for Asia, French Environment & Energy Management Agency (ADEME)
 The Fifth Kitakyushu Initiative Network Meeting (KIN5), 10-11 February 2010, Kitakyushu, Japan

Building, resources and the environment

- Buildings are highly **resource intensive**
 - Raw materials, energy, water
 - Greater demand for resources due to affluence and life style changes
- **30-40% of world's primary energy is used in buildings**
 - Construction
 - Operation & maintenance
- **High growth in demand for new construction**
 - Greenfield projects (ex. Additional 30 billion m² in China by 2020)
 - Demolition of low-rise zones to create high-rise buildings
- **Adverse impacts of buildings on the environment**
 - Contributing to greenhouse gas emissions
 - Depletion of resources & increase in waste generation

S3 The Fifth Kitakyushu Initiative Network Meeting (KIN5), 10-11 February 2010, Kitakyushu, Japan

Energy and buildings

50-100 years lifetime!

- During building construction & renovation (Embodied energy in the building materials, Energy needed during construction & renovation process)
- During building operation over its life span (Energy to achieve thermal and lighting comfort, Energy needed for various types of appliances)

S4 The Fifth Kitakyushu Initiative Network Meeting (KIN5), 10-11 February 2010, Kitakyushu, Japan

Embodied versus operating energy

- Sand to prepare concrete for every million m² of construction kills 100 km² of river beds
- Over 50% building blocks made up of bricks that use valuable top soil and are fired in inefficient kilns

By combining different techniques, **small increases in embodied energy can greatly decrease operating and total energy use**

S5 The Fifth Kitakyushu Initiative Network Meeting (KIN5), 10-11 February 2010, Kitakyushu, Japan

Cost-effective concepts, technologies & products

- Market is ripe with cost effective concepts, technologies & products

- To reduce the need for energy services
 - Optimized design
 - Site planning, shape, orientation, fenestration & shading, natural ventilation, passive cooling, etc.
 - Better implementation
 - Choice of material & technology, optimized insulation of walls & roofs, high performance glazing, artificial lighting & cooling solutions
- To satisfy the needs with more efficient solutions
 - Improved end-use energy efficiency
 - Better artificial lighting & control
 - Better artificial cooling & control
 - Provision of energy services through alternative means & strategies

S6 The Fifth Kitakyushu Initiative Network Meeting (KIN5), 10-11 February 2010, Kitakyushu, Japan

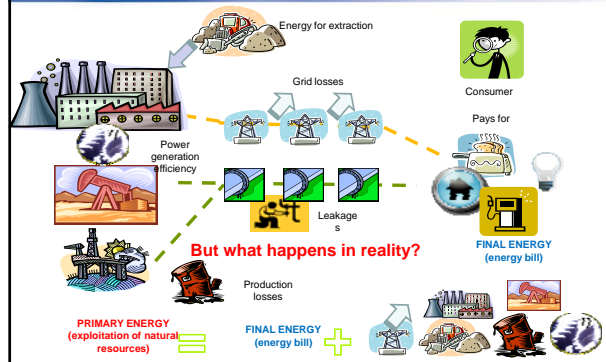

Designing sustainable building

- Overcoming the general perception of sustainable building being more expensive
 - More emphasis on adopting the right building science and less dependence on high-cost building technologies
 - A better scientific understanding of the way buildings work and avoiding high technological sophistication
- The main challenge: **To do more with less**

S7 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan

Story of consumption & production

S8 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan Source: ADEME

Energy supply to service provision

Example of lighting

Lighting consumes about 19% of the world electricity production (Source: IEA)

Thermal power plant conversion efficiency	?	40%
Transmission and distribution losses	?	15%
Incandescent lamp conversion efficiency	?	5%

S9 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan

Technological evolution in the past decade

Example of lighting

In 1931, Thomas Edison told his friends Henry Ford and Harvey Firestone: "I'd put my money on the sun and solar energy. What a source of power! I hope we don't have to wait until oil and coal run out before we tackle that."

S1 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan

Energy supply to service provision

Example of lighting

S1 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan

Roadmap to achieve low carbon green growth

Ideal strategy:

→ Demand-side management followed by supply-side options

– By 2030, global cost of lighting could be reduced by US\$2.6 trillion, resulting in savings of 16 billion tons of CO₂ (Source: IEA)

S1 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan

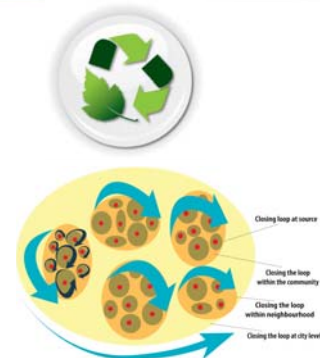

Story of consumption & lack of systemic thinking

- **Analysis of energy systems to highlight losses, hidden costs and multiplying costs that balloon impact of energy use.**
- **Reflection on another aspect—urban consumerism.**
- **Importance of energy efficiency and need for change in consumerism**
- **Impact due of lack of systemic thinking, partiality to mega projects and other slips in effective policy making**
 - Supply of energy and water
 - Infrastructure for mobility
 - Disposal of solid waste

S1 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan

Strategy-based solutions

- **Fundamental to everything is that need is initiated by an individual**
- **Concept of working with closed loops, starting at individual level, moving onto neighborhood and community levels instead of linear functioning of energy systems**
- **Energy savings within built environment**

S1 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan

Designing sustainable building

- **Overall objective: Lower energy consumption and life-cycle costs**
 - Start with building fabrics to lower energy demand (life span: 50-100 years)
 - Then look for devices to generate energy from renewables (life span: 10-20 years)
- **More capital needed for oversized renewable energy systems for a poorly designed building**

S1 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan

Buildings that are less dependent on energy and water

Designing strategy

- **From high energy consuming buildings to zero-energy or energy-positive buildings**
 - Objective: Reduce pressure on local grid, avoid investment in new power plants, limit environmental emissions
 - Strategy: Design buildings to suit the local climate, adopt low-energy service solutions, exploit on- & off-site natural and renewable energies
- **From high water consuming buildings to low-water or water-neutral buildings**
 - Objective: Reduce pressure on centralized water supply systems, avoid investment in new water supply and sewage networks, limit environmental emissions
 - Strategy: Design buildings with low-water consuming options and technologies, cut water needs by treating less-contaminated water for other uses, harvest rainwater and exploit ground water sustainably

S1 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan

Role of public authorities

Strategic objectives to promote eco-efficient buildings

- **Public authorities have major influence in promoting resource-efficient and environment-friendly buildings**
 - Own and occupy vast amount of space
 - Can lead the way and set good example for citizens and private developers
- **A strategy based on large-scale operation**
 - **Regulations**
 - Energy regulations for new & existing (rehabilitated) buildings
 - Regular inspection of boilers & air conditioning equipment
 - **Incentives**
 - Tax incentives
 - Bank subsidized loans
 - New financial tools
 - Energy efficiency certificates

S1 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan

Role of public authorities

Strategic objectives to promote eco-efficient buildings

- **A strategy based on large-scale operation**
 - **Certification & Quality Labels**
 - High Energy & Very High Energy Performance certification
 - High Environmental Quality certification
 - **Awareness raising, training & education**
 - Energy Info Centres
 - Training of building professionals
 - **Research & development, innovation**
 - Design of carbon-neutral buildings
 - Advanced insulation & glazing, & high efficiency appliances
 - Advanced technologies to harness renewable energy
 - Techniques for storage, recovery, heat & cold management

S1 The Fifth Kitakyushu Initiative Network Meeting (KINS), 10-11 February 2010, Kitakyushu, Japan

Role of public authorities

Strategic objectives to promote eco-efficient buildings

- **Reduce the energy use of existing buildings**
 - Thermal insulation of opaque & glazed areas
 - High efficiency appliances & use of renewables
 - Energy legislation for rehabilitated buildings
 - Energy performance certificate for buildings
- **Construct highly efficient buildings**
 - Revise legislation every 5 years
 - Use efficient & innovative techniques
 - Achieve passive energy gains & integrate renewables
